

The Human Body: Muscular-Skeletal System

Integrated Science

By the end of the lesson, learners will be able to identify and name the main components of the human muscular-skeletal system (bones, muscles, and joints).

Why Do We Have a Shape?

The body has a firm framework.

This framework allows us to stand and move.

Without it, we would be like a heap of cloth.

Exploring the Skeleton

The skeleton is the bony framework of the body.

It is made of many bones of different shapes.

It supports the whole body.

Components of the System

Bones: The hard framework.

Muscles: The soft tissues that pull bones.

Joints: The places where two or more bones meet.

How They Work Together

Muscles are attached to bones.

Muscles contract (shorten) to pull bones.

Joints allow the bones to swing or rotate.

Reviewing Our System

The system is called the Muscular-Skeletal System.

Main parts: Bones, Muscles, Joints.

Function: Support, Protection, and Movement.
